

## Sounds Active ESE Remote Installation Guide

The standard installation model for Sounds Active Essential Sound Engineering is to install the software directly from CD-ROM to the target PC or Mac. However, Sounds Active ESE can be installed remotely over a network if required.

In order for a technician to remotely install Sounds Active ESE to multiple remote workstations, the CD-ROM contents must first be copied onto a network drive which is visible from all target workstations.

In addition, the technician must have access to a “remote desktop” tool, which permits live monitoring and remote control of the target workstations. The technician should also have access to our support site, [www.soundsactive.com/unlock](http://www.soundsactive.com/unlock).

Assuming these basic requirements are met, the procedure for remotely installing Sounds Active ESE is as follows:

### PC Windows

- Log into the target workstation via the remote desktop tool.
- Navigate to the network drive containing the CD-ROM contents.
- Follow the instructions given in the “Quick Start” guide (supplied with the CD-ROM) to install and unlock the product.
- Repeat for each workstation.

### Mac OS X

- Log into the target workstation via the remote desktop tool.
- Navigate to the network drive containing the CD-ROM contents.
- Create a temp folder in OS X, and copy the CD-ROM contents into that folder.
- Run “mac-installer.pkg” from the temp folder, and then follow the instructions given in the “Quick Start” guide (supplied with the CD-ROM) to install and unlock the product.
- Repeat for each workstation.

#### Important Note

When a Sounds Active ESE license is first registered, you will be asked for owner/location details and the email address of a nominated contact person. db audioware sends all unlock codes and future support messages to that email address.

For further explanation see [www.soundsactive.com/faq](http://www.soundsactive.com/faq) “How does a Sounds Active ESE license work?”.
